

Features	General Description
----------	---------------------

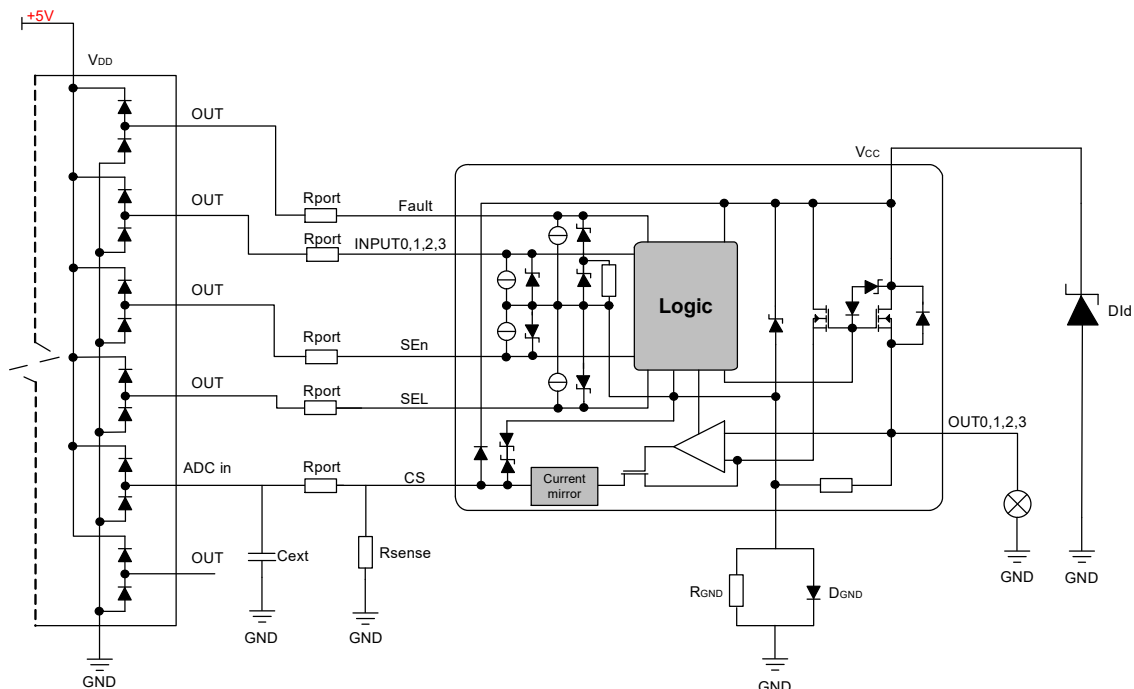

- ◆ Operating voltage range: 4.5V to 28V
- ◆ Load current limitation
- ◆ Output short-circuit protection
- ◆ Standby current <math>< 2.0\mu\text{A}</math>
- ◆ On-state resistance  $\text{Typ}=120\text{m}\Omega$  (per Ch)
- ◆ Thermal shutdown indication
- ◆ OFF-state open-load detection
- ◆ Overvoltage clamp
- ◆ Undervoltage protection
- ◆ Load current with high precision proportional current mirror
- ◆ RoHS compliant and lead free
- ◆ AEC-Q100 qualified

- ◆ WSQ7140AD is quad channel high-side drivers with current sense analog feedback for automotive applications, the devices are designed to drive 12 V automotive grounded loads through a 3 V and 5 V.
- ◆ WSQ7140AD integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off. A Fault pin unlatches the output in case of fault or disables the latch-off functionality.
- ◆ A dedicated multifunction multiplexed analog output pin delivers sophisticated diagnostic functions including high precision proportional load current sense, supply voltage feedback and chip temperature sense, in addition to the detection of overload and short circuit to ground, short to  $V_{CC}$  and OFF-state open-load.
- ◆ A sense enable pin allows OFF-state diagnosis to be disabled during the module low power mode as well as external sense resistor sharing among similar devices.
- ◆ WSQ7140AD is available in DFN5×6-16L package.

### Application

- ◆ All types of automotive resistive, inductive and capacitive loads
- ◆ Specially intended for automotive signal lamps

### Pin Configuration

### Pin Description

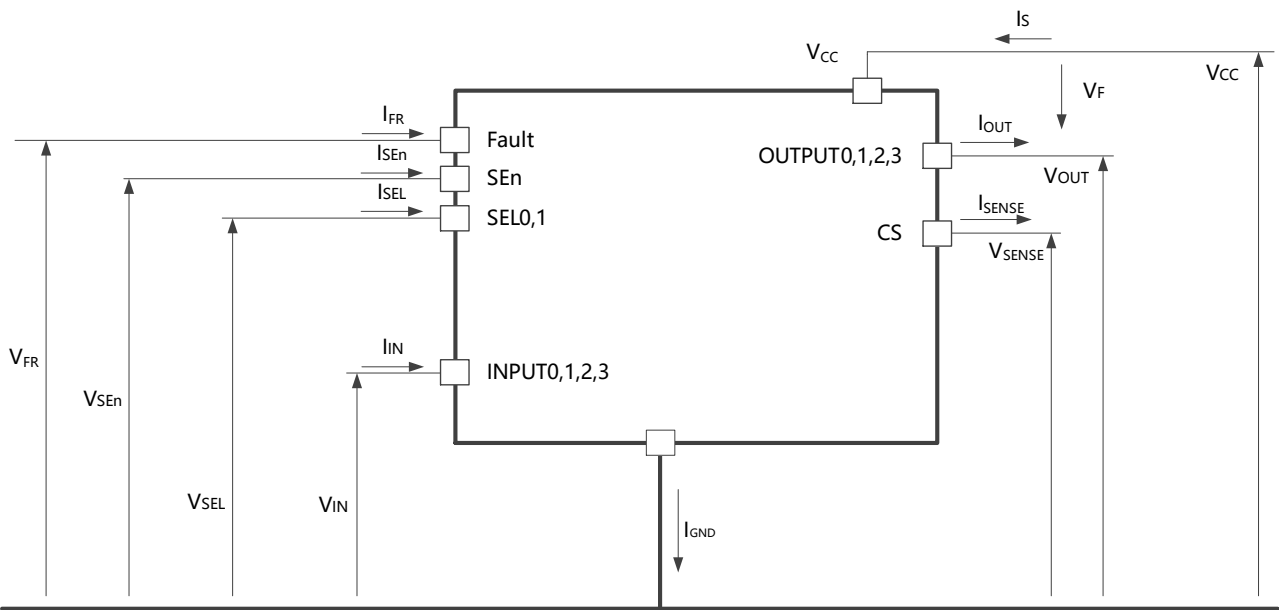

Pin Name	Pin NO.	Pin Description
OUTPUT0/1/2/3	1/8/9/16	Power outputs.
SEn	2	Active high compatible with 3 V and 5 V CMOS outputs pin; it enables the CS diagnostic pin.
INPUT0/1/2/3	3/6/11/14	Voltage controlled input pin with hysteresis, compatible with 3 V and 5 V CMOS outputs. It controls output switch state.
GND	4	Ground connection. Must be reverse battery protected by an external diode / resistor network.
Fault	5	Active low compatible with 3 V and 5 V CMOS outputs pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.
NC	7/10	No connect.
SEL0/1	12/15	Active high compatible with 3 V and 5 V CMOS outputs pin; they address the CS multiplexer.
CS	13	Multiplexed analog sense output pin; it delivers a current proportional to the selected diagnostic: load current, supply voltage or chip temperature.
V <sub>CC</sub>	EPAD	Battery connection.

### Current and Voltage Conventions

Note2:  $V_F = V_{OUT} - V_{CC}$  during reverse battery condition.

### Absolute Maximum Ratings (Note3)

Symbol	Parameter	Value	Unit
V <sub>CC</sub>	DC supply voltage	35	V
-V <sub>CC</sub>	Reverse DC supply voltage	0.3	V
-I <sub>GND</sub>	DC reverse ground pin current	200	mA
I <sub>OUT</sub>	OUTPUT0,1,2,3 DC output current	Internally limited	A
V <sub>IN</sub> , V <sub>SEn</sub> , V <sub>SEL</sub> , V <sub>Fault</sub>	INPUT0,1,2,3, SE <sub>n</sub> , SEL <sub>0,1</sub> , Fault DC input voltage	-0.3 to 6.0	V
I <sub>SENSE</sub>	CS pin DC output current	20	mA
	CS pin DC output current in reverse	-20	
T <sub>j</sub>	Junction operating temperature	-40 to 150	°C
T <sub>stg</sub>	Storage temperature	-55 to 150	

Note3: Stressing the device above the rating listed in Absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied.

Exposure to the conditions in table below for extended periods may affect device reliability.

### ESD Susceptibility (Note4)

Symbol	Parameter	Values	Unit
V <sub>ESD(HBM)</sub> <sup>3)</sup>	ESD Susceptibility all Pins (HBM)	±2	kV
V <sub>ESD(HBM)_OUT</sub>	ESD Susceptibility OUT vs GND and V <sub>CC</sub> connected (HBM)	±4	kV
V <sub>ESD(CDM)</sub> <sup>4)</sup>	ESD Susceptibility all Pins (CDM)	±500	V
V <sub>ESD(CDM)_CRN</sub>	ESD Susceptibility Corner Pins (CDM) (pins 1, 8, 9, 16)	±750	V

Note4:

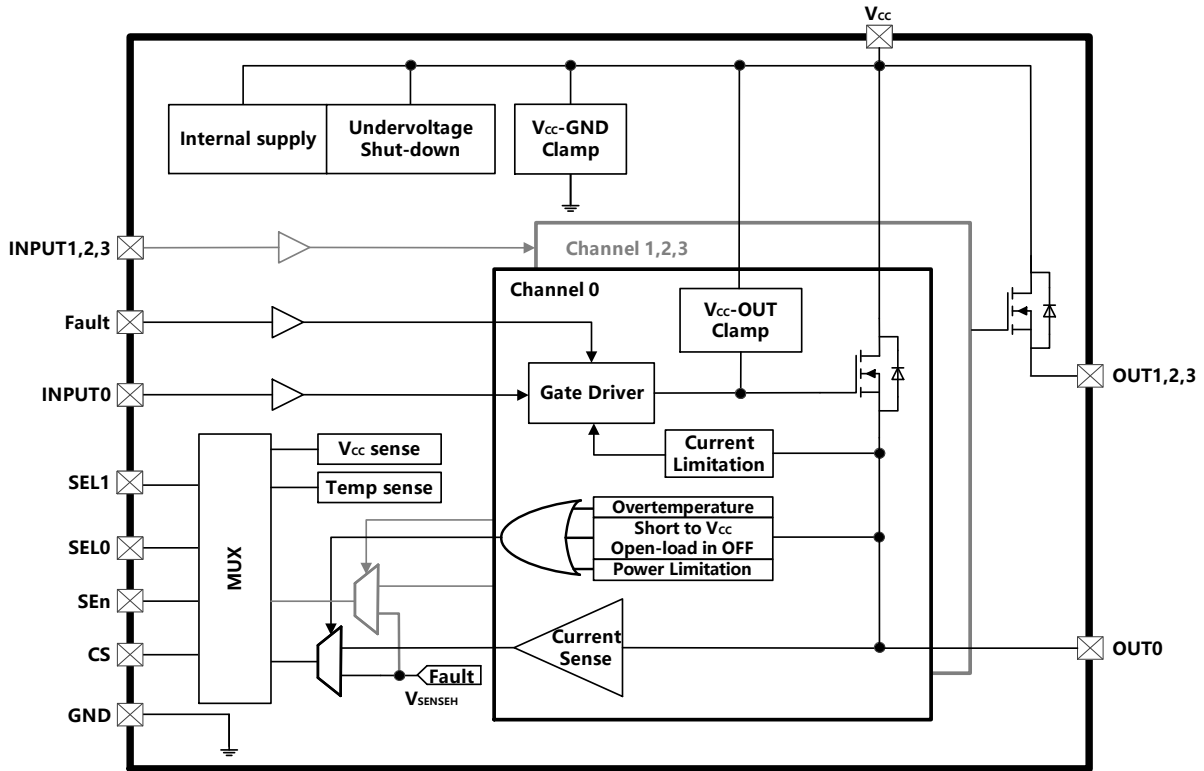

- 1) Not subject to production test - specified by design.
- 2) Maximum digital input voltage to be considered for Latch-Up tests: 5.5 V.
- 3) ESD susceptibility, Human Body Model "HBM", according to AEC Q100-002.
- 4) ESD susceptibility, Charged Device Model "CDM", according to AEC Q100-011.

### Thermal Resistance (Note5)

Symbol	Parameter	Values			Unit
		Min.	Typ.	Max.	
T <sub>JC</sub>	Thermal Resistance Junction-to-Case		1.3		°C/W
T <sub>JA</sub>	Junction-to-Ambient Thermal Resistance		28		°C/W

Note5: According to JEDEC JESD51-2,-5,-7 at natural convection on FR4 2s2p board; the Product (Chip + Package) was simulated on a 76.2 × 114.3 × 1.5 mm board with 2 inner copper layers (2 × 70 μm Cu, 2 × 35 μm Cu). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer.

## Functional Description

### Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing  $\Delta T_j$  through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as  $\Delta T_j$  exceeds the safety level of  $\Delta T_{j,SD}$ . According to the voltage level on the Fault pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (Fault = Low) or remains off (Fault = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

### Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175 °C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the Fault pin, the device switches on again as soon as its junction temperature drops to  $T_R$  (Fault = Low) or remains off (Fault = High).

### Current limitation

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level,  $I_{LIMH}$ , by operating the output power MOSFET in the active region.

### Negative voltage clamp

In case the device drives inductive load, the output voltage reaches a negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value,  $V_{DEMAG}$ , allowing the inductor energy to be dissipated without damaging the device.

### Diode ( $D_{GND}$ ) in the ground line

A resistor (typ.  $R_{GND}=4.7K$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load. This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ( $\approx 600mV$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

### MCU I/Os protection

If a ground protection network is used and negative transients are present on the  $V_{CC}$  line, the control pins will be pulled negative. WS suggests to insert a resistor ( $R_{prot}=15K$ ) in line both to prevent the micro-controller I/O pins from latching-up and to protect the HSD inputs. The value of these resistors is a compromise between the leakage current of micro-controller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of micro-controller I/Os.

### CS - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (CS) delivering the following signals:

- Current monitor: current mirror of channel output current
- $V_{CC}$  monitor: voltage proportional to  $V_{CC}$
- $T_{CASE}$ : voltage proportional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEn pins, according to the address map in CS multiplexer addressing Table.

**Current monitor**

When current mode is selected in the CS, this output is capable to provide:

- Current mirror proportional to the load current in normal operation, delivering current proportional to the load according to known ratio named K
- Diagnostics flag in fault conditions delivering fixed voltage  $V_{SENSEH}$

The current delivered by the current sense circuit,  $I_{SENSE}$  can be easily converted to a voltage  $V_{SENSE}$  by using an external sense resistor,  $R_{SENSE}$ , allowing continuous load monitoring and abnormal condition detection.

While device is operating in normal conditions (no fault intervention),  $V_{SENSE}$  calculation can be done using simple equations.

Current provided by CS output:  $I_{SENSE} = I_{OUT}/K$

Voltage on  $R_{SENSE}$ :  $V_{SENSE} = R_{SENSE} * I_{SENSE} = R_{SENSE} * I_{OUT}/K$

Where:

- $V_{SENSE}$  is voltage measurable on  $R_{SENSE}$  resistor
- $I_{SENSE}$  is current provided from CS pin in current output mode
